5 Functional programming

Overview

1 Introduction

- 2 Basic syntax and automated provers
- 3 Natural deduction
- 4 Isar: a language of structured proofs
- 5 Functional programming

 Isabelle is a generic interactive theorem prover, developed by Lawrence Paulson (Cambridge) and Tobias Nipkow (Munich).
 First released in 1986.

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

- https://isabelle.in.tum.de/
- Archive of formal proofs (https://www.isa-afp.org/)

Isabelle/HOL

It allows mathematical formulas to be expressed in a formal language and provides tools for proving those formulas in a logical calculus.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- Integrated tool support for:
 - Automated provers
 - Sledgehammer: powerful proof search
 - Counter-example finding
 - Code generation
 - LATEX document generation

- Isabelle/HOL Isabelle's incarnation for Higher-Order Logic
- FOL extended with functions and sets, polymorphic types, ...

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

- ML-style functional programming
- "HOL = functional programming + logic"

A Course at University of Belgrade

- Introduction to interactive theorem proving
- Elective course on the 4. year of undergraduate studies of informatics
- 12 weeks of teaching (weekly 1.5 hours lectures and 1.5 hours labs)

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

- Students have some background knowledge in logic and functional programming
- Two parts:
 - Logic and mathematics
 - Functional programming and verification

Approach

- Recapitulation of many concept that students have informally used, but through the lens of interactive theorem proving
- Students need to understand precise, rigorous communication and reasoning (both in abstract mathematics, and in computer programming)
- Slow pace
- Proof assistant is a tool, and not the aim
- Students need not become experts in using some concrete proof assistant
- Concepts are introduced only when necessary, usually through examples
- Using automation is welcome (except in the beginning, when the concept of proof is introduced)

This summer school

We have 4 hours total

- The main aim is to give a brief introduction to Isabelle/HOL to those who did not have any experience with it
- The other aim is to offer a slightly different didactic to proof assistants than the usual one
 - How to teach proof assistants to support better understaning and provide rigour to elementary high-school/undergraduate mathematics and computer science?
 - As close to every day mathematics as possible (focus only on the concepts that students do in elementary mathematics)
 - Focus is not on what proof assistants can do and how are they professionally used, but on how to use them "without tears" as a supplement to introductory math/cs curriculum
- Many exercises that we can do together

Introductory example

- The course starts with an advertisement of interactive theorem proving
 - A brief history
 - Major successes
- Instead of the standard "bottom-up" approach where we strictly define notions before using them, we use a "hands-on" approach where we try to give intuition and formally define notions along the way, only when necessary.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Example: absolute value

- What is an Isabelle/HOL theory?
- We define some mathematical concept.
- We state some of its properties (in form of lemmas).
- We prove those lemmas:
 - using automated theorem provers or
 - we write the proof in some language and the system checks that proof.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

- We start with a very simple example of absolute value function.
- We formalize the beginning of https://en.wikipedia.org/wiki/Absolute_value

Definition:

$$|x| = egin{cases} x, & ext{if } x \geq 0, \ -x, & ext{if } x < 0. \end{cases}$$

Properties:

 $|a| \ge 0$ $|a| = 0 \iff a = 0$ $|ab| = |a| \cdot |b|$ $|a + b| \le |a| + |b|$

Non-negativity Positive-definiteness Multiplicativity Subadditivity, specifically the triangle inequality

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Wikipedia proof

"Non-negativity, positive definiteness, and multiplicativity are readily apparent from the definition.

To see that subadditivity holds, first note that |a + b| = s(a + b)where $s = \pm 1$, with its sign chosen to make the result positive. Now, since $-1 \cdot x \le |x|$ and $+1 \cdot x \le |x|$, it follows that, whichever of ± 1 is the value of *s*, one has $s \cdot x \le |x|$ for all real *x*. Consequently, $|a + b| = s \cdot (a + b) = s \cdot a + s \cdot b \le |a| + |b|$, as desired."

Main takeaways

- Isabelle definitions are very similar to functional programming
- Powerful automation
- Declarative proof language makes proofs very similar to everyday mathematical proofs
- Details of syntax are going to be given throughout the course

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Basic syntax and automated provers

Overview

1 Introduction

- 2 Basic syntax and automated provers
- 3 Natural deduction
- 4 Isar: a language of structured proofs
- 5 Functional programming

Basic syntax and automated provers

Syntax

- Students must be comfortable in translating natural language formulations into formal statements
 - Syntax of the proof assistant
 - Typing symbols
 - Writing logically correct formulae (much deeper skill)
- First lab exercises require to write given statements and prove them using automation (by auto).

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

Basic syntax and automated provers

Examples

- If everyone who lies also steals, and there is someone who lies, then there is somene who steals.
- If no homework is fun, and some reading is homework, then some reading is not fun.
- 3 If there is a shoe that fits every leg, then for every leg there is a shoe that fits it. Does the opposite hold?
- In one village knights always tell the truth, and knaves always lie. Visitor asks the person A if he is a knight, but did not understand his answer. Person B explains that A said that he is a knave, but then C tells that B lies. Prove that C must be a knight.
- 5 If everyone loves a lover and John loves Mary, then does lago love Othello?

Basic syntax and automated provers

- Let f be a binary operation that is associative, has a left-identity element, and all elements have a left inverse. Show that left inverse is always also the right inverse.
- Is every symmetric and transitive relation also reflexive? Is there some additional condition that guarantees it?

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つくぐ

Basic syntax and automated provers

Assume that Pinocchio always lies and says: "All my hats are green". Which of the following must be true.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

- 1 Pinocchio has no green hats.
- 2 Pinocchio has only one green hat.
- 3 Pinocchio has no hats.
- 4 Pinocchio has at least one hat.
- 5 Pinocchio has at least one green hat.

5 Functional programming

Natural deduction

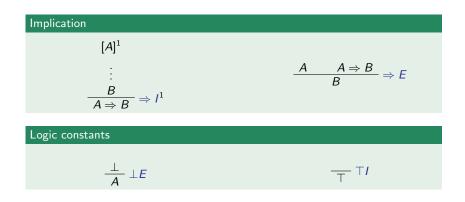

- Two styles of proof in Isabelle/HOL:
 - Tactics (apply style proofs)
 - Isar (readable, structured proofs)
- Although readable proofs are desirable (easier to read, write and maintain), under the hood everything boils down to applying natural deduction rules
- Natural deduction is like an assembly language of interactive theorem proving
- It is good if the students have some understanding of what is happening "under the hood"

└─ Isar: a language of structured proofs

Overview

1 Introduction

- 2 Basic syntax and automated provers
- 3 Natural deduction
- 4 Isar: a language of structured proofs

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

5 Functional programming

└─ Isar: a language of structured proofs

lsar

- Imitate "pen-and-paper" proofs as much as possible
- All proofs must be understandable by reading their text, without running the prover
- Combine with powerful automation
 - Proofs should provide justification
 - Proofs should provide explanation
 - Make a balance write readable proofs and automate trivial parts

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

└─ Isar: a language of structured proofs

How to teach Isar?

- Language Isar allows to express the same proof in many different ways
- Two main styles:
 - backward proofs (from the goal towards assumptions)
 - forward proofs (from the assumptions towards goals)
- Some patterns can be recognized in many proofs
- Introduce the proof language through carefully chosen examples that show different techniques an patterns
- In their previous courses student did not prove formulae of pure logic, but they have experience in proving facts about sets, relations, and functions
- Use those domains to introduce Isar

└─ Isar: a language of structured proofs

A set example

• Prove
$$(A \cup B)^c = A^c \cap B^c$$

Top-level proof structure:

```
lemma "-(A \cup B) = -A \cap -B"

proof

show "-(A \cup B) \subseteq -A \cap -B"

sorry

show "-A \cap -B \subseteq -(A \cup B)"

sorry

qed
```

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

└─ Isar: a language of structured proofs

Backward proof

- Proof is either applcation of an automatic proof method by ... or consists of a proof...qed block
- The keyword proof can be followed by a proof method that transforms the goal
- If method is not specified the system chooses a method based on the structure of the current goal
- In this example the method rule equalityI is chosen

$$equalityI \quad : \quad [\![A \subseteq B; B \subseteq A]\!] \Longrightarrow A = B$$

- The proof state becomes: proof (state) goal (2 subgoals): $1. -(A \cup B) \subseteq -A \cap -B$
 - 2. $-A \cap -B \subseteq -(A \cup B)$
- The proof continues by explicitly stating and proving each goal

└─ Isar: a language of structured proofs

Each subgoal can be proved by using a backward proof

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つくぐ

```
lemma "-(A \cup B) = -A \cap -B"
proof
    show "-(A \cup B) \subseteq -A \cap -B"
    proof
        fix x
        assume "x \in -(A \cup B)"
        show "x \in -A \cap -B"
            sorry
    qed
next
    show "-A \cap -B \subseteq -(A \cup B)"
    proof
        fix x
        assume "x \in -A \cap -B"
        show "x \in -(A \cup B)"
            sorry
    qed
qed
```

└─ Isar: a language of structured proofs

In both subgoals the proof keywords triggers the rule subsetI method.

subset
$$I$$
: $(\bigwedge x. x \in A \Longrightarrow x \in B) \Longrightarrow A \subseteq B$

The first subgoal becomes:

$$\bigwedge x. \ x \in -(A \cup B) \Longrightarrow x \in -A \cap -B$$

▲□▶ ▲□▶ ▲臣▶ ▲臣▶ 三臣 - のへで

In Isar this becomes fix ... assume ... show ...

└─ Isar: a language of structured proofs

Forward proof

- Let us focus on the first subgoal
- At this point we have both an assumption that we can use $(x \in -(A \cup B))$, and the goal that should be proved $(x \in -A \cap -B)$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三 ● ●

- From the assumption we can deduce some new facts
- We can state them using the keyword have:

```
fix x
assume "x \in -(A \cup B)"
have "x \notin A \cup B"
...
show "x \in -A \cap -B"
sorry
```

└─ Isar: a language of structured proofs

Proof context

- If not stated otherwise, in each (sub)goal the prover "sees" only the formula that should be proved
- In order to use avaiable assumptions they must be brought in the proof context
- There are various (equivalent) ways to do that (e.g., from, using, ...)

```
fix x
assume "x \in -(A \cup B)"
from 'x \in -(A \cup B)'
have "x \notin A \cup B"
by (rule complD)
show "x \in -A \cap -B"
sorry
```

```
fix x
assume "x \in -(A \cup B)"
have "x \notin A \cup B"
using 'x \in -(A \cup B)'
by (rule complD)
show "x \in -A \cap -B"
sorry
```

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへで

└─ Isar: a language of structured proofs

Abbreviations

Many abbreviations (some are deprecated)

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ - つくぐ

- this the last statement
- then from this
- hence then have
- thus then show
- with ... from this and ...

```
fix x
assume "x \in -(A \cup B)"
then have "x \notin A \cup B"
by (rule compID)
show "x \in -A \cap -B"
sorry
```

└─ Isar: a language of structured proofs

Demo

DEMO 4: Isar.thy

(ロト (個) (E) (E) (E) (E) のへの

Isar: a language of structured proofs

Reasoning by cases

Let us focus on the second subgoal

```
show "-A \cap -B \subseteq -(A \cup B)"
proof
    fix x
    assume "x \in -A \cap -B"
    then have "x \notin A" "x \notin B"
        by auto
    show "x \in -(A \cup B)"
    proof
        assume "x \in A \cup B"
        show False
            sorry
    qed
qed
```

└─ Isar: a language of structured proofs

Reasoning by cases (disjunction elimination)

- Currently we have that x ∉ A, x ∉ B, and x ∈ A ∪ B, and we need to derive a contradiction.
- It easily follows by considering cases x ∈ A and x ∈ B that follow from x ∈ A ∪ B.
- If we bring a disjunctive fact such as x ∈ A ∪ B as the first fact into the proof context, the proof applies reasoning by cases (elimination rules such as UnE, disjE, ...).

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

└─ Isar: a language of structured proofs

```
assume "x \in A \cup B"

then show False

proof

assume x \in A"

with 'x \notin A' show False

by - (erule notE)

next

assume x \in B"

with 'x \notin B' show False

by - (erule notE)

qed
```

└─ Isar: a language of structured proofs

Introducing universal quantifiers

- Prove that every symmetric transitve relation, with no isolated elements is reflexive.
- Since the goal starts with the universal quantifier, proof automatically chooses the *alll* rule – prove the statement for an arbitrary element *x*.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ◆ ○ ◆ ○ ◆

```
lemma

assumes "\forall x. \exists y. R \times y"

sym: "\forall x y. R \times y \longrightarrow R y x"

trans: "\forall x y. R \times y \longrightarrow R y x"

shows "\forall x. R \times x"

proof

fix x

show "R \times x"

sorry

qed
```

└─ Isar: a language of structured proofs

Eliminating existential quantifiers

 We can always name an element for which we know it exists using the keyword obtain

lemma

```
assumes "\forall x. \exists y. R \times y"
         sym: "\forall x y. R x y \longrightarrow R y x"
         trans: "\forall x y. R x y \longrightarrow R y x"
    shows "\forall x. R \times x"
proof
    fix x
    from assms(1) obtain y where "R \times y"
         by auto
    with sym have "R \ v \ x"
         by auto
    from "R \times y" "R y x" show "R \times x"
         using trans
         by auto
qed
```

└─ Isar: a language of structured proofs

Proof by contradiction (rule ccontr)

```
Prove the "drinkers paradox":

\exists d. drinks \ d \longrightarrow (\forall x. drinks \ x).
```

```
lemma "\exists d. drinks d \longrightarrow (\forall x. drinks x)"

proof (rule ccontr)

assume "\neg?thesis"

then have "\forall d.\neg(drinks d \longrightarrow (\forall x. drinks x))"

by auto

then have "\forall d.drinks d \land \neg(\forall x. drinks x)"

by auto

then have "(\forall d.drinks d) \land \neg(\forall x. drinks x)"

by auto

show False

by auto

qed
```

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

└─ Isar: a language of structured proofs

Proof by cases (cases)

 Alternative proof considers cases when everybody drinks and when there is someone who does not drink.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

```
lemma "\exists d. drinks d \longrightarrow (\forall x. drinks x)"
proof (cases "\forall x. drinks x")
    case True
    then show ?thesis
        by auto
next
    case False
    then obtain d where "\neg drinks d"
        by auto
    then have "drinks d \longrightarrow (\forall x. drinks x)"
        by auto
    then show ?thesis
        by auto
qed
```

└─ Isar: a language of structured proofs

Exercises

- Let us do some exercises about functions
- Library predicates inj, surj, bij hold for injective, surjective, and bijective functions
- $f \circ g$ denotes the function composition
- f ' A denotes the image of the set A under the function f

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

■ f - ' A denotes the inverse image the set A under the function f

└─ Isar: a language of structured proofs

Moreover-ultimately

- Often the final statement follows from several intermediate statements
- A special moreover...ultimately syntax can abbreviate such proofs so that there is no need to explicitly recall intermediate statements and insert them into the proof context of the final statement

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

└─ Isar: a language of structured proofs

Moreover-ultimately

```
lemma
   assumes "surj f" "surj g"
   shows "surj (f \circ g)"
   unfolding surj_def
proof
   fix y
   obtain z where "f z = y"
       using 'surj f' unfolding surj_def by metis
   moreover
   obtain x where "g x = z"
       using 'surj g' unfolding surj_def by metis
   ultimately
   show "\exists x. y = (f \circ g)x"
       unfolding comp_def by auto
qed
```

Demo

DEMO 4: Isar.thy (cont.)

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

└─ Isar: a language of structured proofs

Numbers

- Several number types (nat, int, rational, real, complex)
- Choosing appropriate number type is sometimes essential
- Be careful to specify number type, since Isabelle often cannot automatically deduce exact number type
- You can apply all field laws on rational, real and complex numbers
- You can apply usual subtraction laws on integers, but not on naturals
- Proving inequalities is usually much harder then proving equalities
- Proving rational expressions is usually harder than proving polynomials

- ロ ト - 4 回 ト - 4 □ -

. . . .

└─ Isar: a language of structured proofs

Field simps

 Many equational theorems about rational and real numbers can be proved by using simplifier with algebra_simps and field_simps collections of theorems

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

lemma

fixes x y :: real shows " $(x + y)^2 = x^2 + 2 * x * y + y^2$ " by (simp add: power2_eq_square algebra_simps)

└─ Isar: a language of structured proofs

Equational reasoning (also-finally)

- In classical mathematics we usually reason by writing chains of equalities (or consistently oriented inequalities, mixed with equalities)
- \blacksquare This reasoning is implicitly based on transitivity of =, \leq , \geq
- Isabelle has special syntax also...finally for this type of reasoning

・ロト ・ 母 ト ・ ヨ ト ・ ヨ ・ うへつ

└─ Isar: a language of structured proofs

Equational reasoning (also-finally)

```
lemma

fixes x y :: real

shows "(x + y)^2 = x^2 + 2 * x * y + y^2"

proof-

have "(x + y)^2 = (x + y) * (x + y)"

sorry

also have "... = x * (x + y) + y * (x + y)"

sorry

...

also have "... = x<sup>2</sup> + 2 * x * y + y<sup>2</sup>"

sorry

finally show ?thesis
```

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

qed

└─ Isar: a language of structured proofs

- method subst ... makes a substitution of an eqation (rewrite rule) within the current goal
- method subst (asm) ... makes substitution of an eqation (rewrite rule) within the current assumptions

Some basic theorems that can be used as rewrite rules:

• add.assoc:
$$(x + y) + z = x + (y + z)$$

- add.commute: x + y = y + x
- mult.assoc: (x * y) * z = x * (y * z)
- mult.commute: x * y = y * x
- distrib_left: (x + y) * z = x * z + y * z
- distrib_right: z * (x + y) = z * x + z * y

theorems can be instantiated

■ add.assoc[of 1 2] gives (1+2) + z = 1 + (2+z)

Generalizing induction hypothesis

 Induction hypothesis can sometimes be to weak and must be generalized to become useful

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Example – reverse list in linear time:

```
primrec reverse' where
    reverse' [] acc = acc
| reverse' (x # xs) acc = reverse' xs (x # acc)
definition reverse where
    "reverse xs = reverse' xs []
```

-Functional programming

```
The induction hypothesis holds for acc, but we need it for the
  term x # acc.
  lemma "reverse' xs acc = reverse xs @ acc"
  apply(induction xs)
  ...
  using this:
      reverse' xs acc = reverse xs @ acc
  goal (1 subgoal):
      1. reverse' (x \# xs) acc = reverse (x \# xs) @ acc
  . . .
      1. reverse' xs (x \# acc) = (reverse xs @ [x]) @ acc
  . . .
      1. reverse' xs (x \# acc) = reverse xs @ (x \# acc)
Keyword arbitrary:
  lemma "reverse' xs acc = reverse xs @ acc"
      by (induction xs arbitrary: acc) auto
```

Functional programming

Demo

DEMO 6: ListAndTrees.thy (cont.)

- Functional programming

General recursion and induction

- Not all recursion patters correspond to primitive recursion over algebraic datatypes
- Isabelle supports general recursion
- Defining general recursive functions requires proving their termination (that can sometimes be done automatically)
 - fun define a general recursive function and prove its termination automatically
 - function define a general recursive function and leave proving its termination to the user
 - It is sometimes possible to define partial functions, that terminate only for some values in their domain

Functional programming

```
fun (sequential) power :: "nat \Rightarrow nat \Rightarrow nat" where

"power x 0 = 1"

| "power x n =

(if n mod 2 = 0 then

power (x * x) (n div 2)

else

x * power x (n - 1))"
```

Functional programming

Axiomatic reasoning

- Two ways to specify axioms
 - axiomatization
 - locale (fixes constants and assumes their properties)
- Locales can be interpreted
 - ensures that axioms are consistent
 - theorems proved abstractly become available for a concrete interpretation

Locales

```
locale Geometry =

fixes cong :: "'a \Rightarrow 'a \Rightarrow 'a \Rightarrow 'a \Rightarrow bool"

assumes cong_refl: "\land x \ y. \ cong \ x \ y \ y \ x"

assumes cong_id: "\land x \ y \ z. \ cong \ x \ y \ z \ z \Longrightarrow x = y"

...

begin

definition ...

lemma ...

end
```
